Implementation of Custom Favicon

Favicon Overview

A favicon is a small icon that appears in the browser tab or next to the page name in the bookmarks. It helps in branding and provides a visual identity for the website.

Favicon Implementation

- 1. Custom Icon: You have already created a custom icon for your project. Ensure that this icon is appropriately sized and saved in a standard format (e.g., PNG).
- 2. HTML Implementation: Add the following code inside the <head> section of your HTML document to link the custom icon as a favicon:

```
<link rel="icon" href="images/logo.png" type="image/png">  
<link rel="shortcut icon" href="images/logo.png" type="image/png">
```

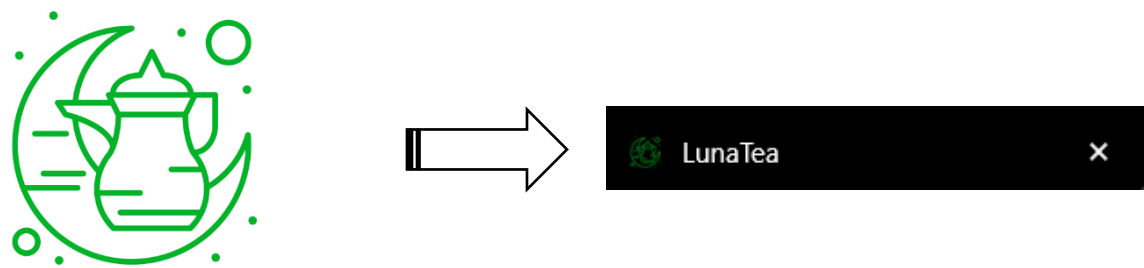

Ensure that the href attribute points to the correct path of your custom icon.

Updated Code Example

Assuming your custom icon is saved as "logo.png" in the "images" directory:

```
<link rel="icon" href="images/logo.png" type="image/png">  
<link rel="shortcut icon" href="images/logo.png" type="image/png">
```

Favicon:

Conclusion

This documentation affirms the presence of a custom favicon in the project. Ensure the custom icon is appropriately sized and saved in a standard format. Update the HTML code to link to the correct path of the custom favicon.

Additional Notes

- Website test shows that my custom favicon is compatible with Google.
